Omnichannel ticket intake: classify, route, and answer from the knowledge base when sure

THE STORY

The Group Service Desk in Ahmedabad looks after four Ashvaka companies, from the head office to cement plants, a solar park and project sites. In the week of 05 to 09 October, 223 new tickets land in one unassigned queue: 99 emails, 67 portal forms, 31 phone notes and 26 chat transcripts, each written its own way. Every ticket needs a category, a priority worked out from impact and urgency, and the right support team, and many ask questions the knowledge base seems to answer. But some articles describe the process before a recent change, others fit a neighbouring product or only half the question, and a live outage at one site sends in complaints that do not look related. Your AI Employee turns every message into one clean ticket record, routes it with a reason, answers only when a valid article covers all of it, and hands the rest to the right team with a note they can act on.

OPEN THESE THREE FILES FIRST

- 1 **dataset/csv/incident_new.csv** The trigger: all 223 tickets from four channels, so you see how differently each one arrives.
- 2 **dataset/reference/Routing_and_Triage_Policy.md** The rules: sections 3, 4, 5, 8, 9, 10 and 12 cover the minimum, and it points to Routing_Rules and Priority_Matrix.
- 3 **dataset/csv/kb_knowledge.csv** Every article version with its status, dates, product and version, which decide whether an answer may be sent.

WORDS YOU WILL MEET

Ticket (incident) One fault or request reported to the service desk, recorded with a number like INC0045114. Whatever the channel, each one must end up as the same kind of record.

KB article A knowledge base page with fix steps, kept in numbered versions. Only a published version inside its dates, written for the caller's product and version, may be sent; retired and draft versions are searchable but must not be cited.

Assignment group The support team that owns a ticket, such as Network Ops or SAP FI Support. Routing_Rules names the group for each category and subcategory.

Confidence threshold The minimum confidence at which the AI Employee may resolve a ticket without a person checking it. The Service Desk Manager sets it and the policy says it is not set yet, so your build needs a setting a human controls.

CI and CMDB A configuration item (CI) is one system, link or device IT runs, such as a VPN gateway or a site's internet line. The CMDB is the list of them (cmdb_ci), with the owning team and whether each is working right now.

Outage and major incident An outage is a system or link that is down. When it hits many people it is run as one major incident (see incident_active), and every ticket it causes is linked to that record instead of being fixed one by one.

Impact How much of the business a problem touches. Low is one user, Medium is a team or one user who holds up plant dispatch, High is a plant, a whole site or more than 20 users.

On-call rota The list of who answers each team's urgent tickets outside 09:00 to 18:30 Monday to Saturday, by date, with mobile numbers. P1 and P2 tickets out of hours page that person.

Urgency How badly the work is stopped. High means stopped with no workaround, Medium means slowed or a workaround exists, Low is a request or a question; a caller writing URGENT does not change it on its own.

Handover note The note that travels with a routed or escalated ticket so the receiving engineer can act without reading the thread. It covers the caller, what was asked, what was tried, the articles considered and why they fail, related tickets and the priority.

Priority matrix The table that turns impact and urgency into a priority from P1 (critical) to P4 (low), with a response and fix target for each. Priority decides who is paged and how fast.

UTC and IST Some systems stamp times in UTC and end them with a Z. India time (IST) is 5 hours 30 minutes ahead, and working hours are always judged in IST.

ONE RECORD, END TO END

Ticket INC0045114: a VPN error the knowledge base nearly answers

- 1 Open mailbox/inbox/0090__20261009_1138.eml (row INC0045114 in incident_new): Lakshmi Oza installed SecureReach 5, gets 'Error -6005: certificate validation failed', and cannot work from home.
- 2 Normalise it into the ticket record: caller lakshmi.oza in sys_user (Area Sales Officer, Ahmedabad Head Office, AI10, vip false); 'AHMEDABAD HEAD OFFICE' becomes Ahmedabad Head Office; received Fri 09 Oct 11:38 IST, inside working hours.
- 3 Classify with Routing_Rules RR12, Network > VPN (signal 'VPN error code'), whose assignment group is Network Ops.
- 4 Prioritise: one user, so impact 3 (Low); work stopped with no workaround, so urgency 1 (High); Priority_Matrix gives 3 - Moderate, which is P3 with a 4-hour response target.
- 5 Search kb_knowledge for SecureReach: KB0010012 v3.1 is retired and written for v4, KB0010090 v1.0 is published for v5 but covers install only and says to raise error codes with Network Ops, and KB0010091 v0.3 holds the fix but is a draft.
- 6 Check related records: Change_Calendar CHG0030441 moved users to v5 on 01 Oct, and open ticket INC0044424 in incident_active (Network Ops, On Hold) already tracks -6005 errors and asks for new ones to be linked to it.
- 7 Confidence is low and no citable article covers the ticket, so do not resolve: route to Network Ops with a handover note, relate it to INC0044424, acknowledge the caller, and propose that KB0010091 be published.

Outcome. Not resolved from the knowledge base. The ticket goes to Network Ops at P3, in hours, with a handover note naming KB0010012 v3.1, KB0010090 v1.0 and draft KB0010091 v0.3 and why none can be sent. It is related to the open -6005 ticket INC0044424, which hiral.mistry of Network Ops is working, and the desk proposes that Network Ops publish KB0010091.

Why. Policy section 8 allows a knowledge base resolution only from a published, in-date article for the caller's product and version that covers the whole question, and bars retired and draft articles; none of the three passes, so section 10 sends it to a person instead of guessing. Section 12 sets the handover content and section 14 lets the desk propose an article but not publish one, so a Network Ops engineer makes the actual fix.

WHAT THE ROUND 1 MINIMUM NEEDS

Tables	new_tickets (incident_new), user_directory (sys_user), routing_rules (Routing_Rules), priority_matrix (Priority_Matrix), kb_articles (kb_knowledge), change_calendar (Change_Calendar). Everything else in the pack is optional for the minimum, and every table is ready to import from setup_kit/ in this folder.
Staged replies	None. The staged replies saying a fix did not work belong to Strong.
Watch for	Portal tickets are contact_type self-service in incident_new. The policy sets no confidence threshold: propose one and let a human set it.

WHAT THE JOB COSTS BY HAND

223 tickets arrived in the five working days from 05 to 09 Oct 2026, about 1,000 a month. Time one by hand: minutes per record times records per month is what your AI Employee gives back.
